

Flood protection

Protect your home

In recent years, vulnerable areas near rivers, streams and lakes have seen an increase in the number of floods. In extreme cases, a flood or mudslide can cause serious damage to your property. But you can protect yourself against the worst by taking the right precautions. Mobile systems from HOWASU and WaterSAVE will protect your buildings, goods, and equipment against floods and backups from drains.

Flood as a natural hazard

The number of flood events and downpours has risen steeply in recent years, not least as a result of climate change. Such events often cause severe damage to buildings and goods, and may also injure people and animals.

You can reduce your exposure to events of this kind by taking specific precautions. HOWASU and WaterSAVE are innovative branded flood defense systems that enable you to protect your home or business against potential floods or mudslides.

Quick and reliable

When water starts to rise, portable defense systems must be installed as quickly as possible and in the right places. Experienced staff from Fischer Bauservice GmbH, the distributor of HOWASU and WaterSAVE systems, will be glad to advise you.

The HOWASU and WaterSAVE systems are not only flexible and portable, they are also quick and easy to set up. In addition, they include a valve that prevents sewage from backing up into buildings. See for yourself how effective the flood protection products on the market really are.

**Protects property against
floods and water backups**

**Mobile and flexible
protection**

**Special discount
for AXA clients**

Act now /

As a client of AXA you are entitled to a special discount on the following innovative flood defense systems from Fischer Bauservice GmbH, the distributor of HOWASU and WaterSAVE products:

Overview of the systems

FloodStop

FloodStop is a system of inflatable cushions that are designed to fit each opening of a building (doors, windows, air vents, etc.) and then inflated up to 0.7 bar. The cushions squeeze tightly into the contours of the frame, firmly sealing the opening against water levels of up to 2.20 meters for at least 200 hours. The cushions can be used over and over.

CHT

Portable aluminum flood protection system for doors and windows, installs in seconds and without tools. Depending on the situation, the units can also be stacked.

DPS 2000

DPS 2000® is a patented dam beam system designed for large-scale flood prevention. This is how it works: Lightweight aluminum beams are stacked between rails on each end. The beams, which have interlocking profiles, fill with water as water levels rise, adding stability to the system. The mounting frame is installed flush against the exterior of the building, thus preventing the water from seeping through.

Valve to prevent waste water from backing up

This device, which can be installed through an inspection chamber, automatically prevents waste water and sewage from backing up. It is self-activating and does not require a power source.
